Petal Pages — Theme

A customizable, pastel-inspired personal website template built with HTML, CSS, and vanilla JavaScript. The theme comes with original styling and image placeholders; no images from the inspiration website are included.

Quick start

Open `index.html` in a text editor such as VS Code, Notepad++, or your hosting service's code editor.

Update the `<title>`, website name, tagline, and sample text in the HTML.

To customize colors, fonts, and site width, edit the CSS variables under `:root` near the top of the file.

To use your own images, create an `images` folder alongside `index.html` and upload your files into it.

Find `THEME_IMAGES` near the end of `index.html` and replace empty strings with image paths, such as `images/banner.jpg`.

Replace sample links and the placeholder email address (`hello@example.com`) with your own information.

Upload `index.html` and your optional `images` folder to Neocities, GitHub Pages, or any static website host.

Image placeholders

Image	Configuration key	Recommended dimensions
Main banner	`hero`	720 × 280 px
Profile picture	`portrait`	280 × 280 px
Gallery image 1	`gallery1`	320 × 240 px
Gallery image 2	`gallery2`	320 × 240 px
Gallery image 3	`gallery3`	320 × 240 px
Small sidebar / album image	`mini`	240 × 160 px

These dimensions are recommendations, not fixed limits. Images are automatically scaled and cropped to fill their containers using `background-size: cover`. Empty image settings display a visible placeholder with the suggested image size.

Included features

Desktop navigation and a clickable “extras” dropdown.

Collapsible mobile navigation.

Responsive layout for desktop, tablet, and mobile.

About/profile sidebar, journal cards, gallery, favorites, status, and contact section.

Editable color and font variables.

Automatic current-year display in the footer.

No external JavaScript libraries required.

Demo content and links

The journal entries, status, music section, tags, and other text are examples only. “Read more” currently links back to the journal section because no separate blog post pages are included. Replace those links when you create individual posts.

The guestbook section does not contain a server-side guestbook. The example button opens an email draft; you can replace it with the URL of your preferred guestbook service.

Font customization

The theme uses common system fonts by default. Change `--font-title`, `--font-body`, and `--font-small` in `:root` to use other fonts.

Sharing the theme

This package contains the editable template and this guide. Add your own attribution, license, and distribution terms before publishing it for other people to download.
